Emissions Evidence Report

Evidence ID: EVID-TEST-2026-001 | Reporting period: Q3 2026

Purpose

This fictional evidence document is prepared for testing an evidence-upload and IPFS storage workflow. It demonstrates how an emissions report can identify an incorrect value, explain the calculation error, and provide a corrected emission figure.

1. Reported Emission

Field	Reported value
Facility	Northwind Manufacturing - Test Facility A
Emission source	Natural gas combustion in process boiler
Activity data	10,000 m³ of natural gas
Emission factor used	2.00 kg CO2e per m³
Reported emission	20,000 kg CO2e (20.00 t CO2e)

2. Identified Error

The reported calculation used an outdated emission factor of 2.00 kg CO2e/m³. The applicable factor for the test scenario is 1.85 kg CO2e/m³. The activity data of 10,000 m³ was checked against the meter log and is unchanged.

3. Corrected Emission Calculation

Calculation step	Value
Verified activity data	10,000 m³ natural gas
Correct emission factor	1.85 kg CO2e/m³
Corrected calculation	10,000 × 1.85 = 18,500 kg CO2e
Corrected emission	18,500 kg CO2e (18.50 t CO2e)
Difference from reported value	-1,500 kg CO2e (-7.50%)

4. Evidence References

Reference	Description	Status
METER-LOG-TEST-09	Fictional meter log showing 10,000 m³ consumption	Reviewed
EF-TEST-2026-185	Fictional approved emission factor: 1.85 kg CO2e/m³	Applied
CALC-TEST-001	Recalculation worksheet supporting 18.50 t CO2e	Verified

5. Conclusion

The originally reported emission of 20.00 t CO2e is incorrect for this test scenario. After applying the verified emission factor, the corrected emission is 18.50 t CO2e. This document contains fictional numbers and is intended solely for testing document upload, encryption, hashing, CID generation, and retrieval.
